**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

### Office Action Summary

**Application No.**

10/585,729

**Applicant(s)**

MAEDA ET AL.

**Examiner**

ERIN B. SAAD

**Art Unit**

1735

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 13 January 2011.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 4 and 8-10 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 4 and 8-10 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 12 July 2006 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☒ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☒ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

**Attachment(s)**

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Transposition of Patent Drawing Review (PTO-940)
- 3) ☐ Information Disclosure Statement(s) (PTO/SB-08)  
Paper No(s)/Mail Date \_\_\_\_\_
- 4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date \_\_\_\_\_
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: \_\_\_\_\_

**DETAILED ACTION**

***Claim Rejections - 35 USC § 112***

1. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

2. Claims 4, 8-10 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention. The new limitation in claim 4 stating that "the soldered portion is uniformly formed by the solder portion and most of the metal powder included in the soldering paste for coating in the step (a)" is considered new matter because the specification does not implicitly or explicitly disclose this limitation.

3. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

4. Claims 4, 8-10 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. Claim 4 is indefinite because it is unclear what is meant by the term *easily* in the limitation "the solder portion easily wets and spreads along the surface of the solder paste when the solder portion is fluidized". The term *easily* is considered a relative term and it is unclear how *easily* the solder portion would

need to wet and spread along the surface of the solder paste. For the purpose of examination, it is the Examiner's position that if the prior art teaches that the solder wets the surface, then it meets the limitation.

***Claim Rejections - 35 USC § 103***

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

3. Claims 4 and 10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Maeda et al (US 6,189,771) in view of Mei (US 6,680,128), and further in view of the collective teachings of Kudas (US 6,951,666) and Kang et al (US 5,837,119).

In regards to claim 4, Maeda discloses a method for soldering a first electrode 18 with a solder portion 19 to a second electrode 12 by melting under heat the solder portion of the first electrode (column 4 lines 38-51), as observed in the sequences depicted in figures 4A-4B, where electrode 18 (shown but not labeled in figure 4; shown and labeled in figure 3 which is an embodiment of figure 4) and electrode 12 are the first and second electrode, respectively.

Maeda discloses (a) coating a metal (solder) paste 5 on at least one of the solder portion 19 of the first electrode, the soldering paste formed of resin (flux) component (column 4 lines 1-8). Maeda discloses that the solder portion is melted and the solder portion wets the metal paste (column 4 lines 22-36). Since Maeda discloses "wetting" of the solder paste, it is the Examiner's position that the solder portion easily wets and spreads along the surface of the solder paste when the solder portion is fluidized.

Maeda discloses (b) positioning the first electrode directly above the second electrode so the metal paste 5 placed between the solder portion (on the solder ball 19) of the first electrode and the second electrode (metal paste 5, figures 4A-4B).

Maeda discloses (c) letting solder come in contact with the second electrode by melting the solder under heat and wetting and spreading the molten solder along the surface of the metal powder included in the solder paste by guiding/directing the molten solder (column 3 lines 22-35 and column 5, lines 13-65).

Maeda discloses (d) solidifying the molten solder after letting molten solder come in contact with the first electrode and the second electrode, thereby forming a soldered portion which connects the first and second electrode (column 4 lines 21-36).

Maeda teaches that the metal paste is made by mixing a metal and flux (column 4, lines 1-4). However, Maeda fails to teach that the paste includes a liquid basis formed of resin component, an activator removing oxide film produced on surfaces of the solder portion, a metal powder having a core metal and a surface metal to cover surfaces of the core metal and that core metal includes tin or a tin-based alloy and the surface metal includes silver.

However, Mei teaches solder pastes where a particular solder composition is most preferably a metal alloy of tin and zinc (core metal) coated with a material preferably selected from copper, silver, palladium, tin, or gold (Column 2, lines 19-24). Mei also teaches that the coated solder composition used in the solder paste is also suitable for being combined with a flux containing a rosin, derivatives of a rosin such as a dimerized resin, an activator, and a solvent (Column 4, lines 40-49), thus the paste would have a sense of liquidity (liquid basis).

In view of Mei's teachings, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine, with Maeda's soldering method that solders together two electrodes by a soldering bump through the use of a soldering paste, a particular soldering paste that contains a core and surface metal, since using a paste that contains a core and surface metal would allow for lower melting points, longer shelf life, and better effective wettability properties (Mei, Column 3, lines 5-10).

Since Maeda teaches a similar soldering method as the current invention (as stated above) and the solder paste of Maeda as modified by Mei is not structurally indistinguishable from the solder paste of the current invention, it would necessarily flow

that the surface of the core metal is exposed at a portion of the metal powder which is not in contact with the molten solder while the surface metal is taken into the core metal by dissolution. Even though a portion of the surface metal powder may not be in contact with the molten solder, the surface metal powder would still be heated and melted when the components are placed in the reflow furnace.

Maeda does not specifically disclose the shape of the metal powder. Mei discloses that the solder powder may be spherical or amorphous (column 3 lines 55-63). This would indicate that Mei is open to the powder being different shapes, including flake-like. While Mei does not *specifically* disclose using a metal powder with a flake-like shape, Kodas teaches the use of metal powders that have a flaky form with very large aspect ratios (column 4, lines 60-66) to form conductive features (column 35, lines 1-18). Where according to Kang, soldering or electrically conductive pastes (column 2, lines 20-25) with metal powders in the flaky form because of their higher aspect ratios are more desirable than metal powder in the regular spherical form because flaky powders provide for better electrical conduction because of their larger aspect ratios, i.e. length of the flake is larger than the width of the flake (Kang, column 5, lines 35-40). It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the method of Maeda in view of Mei to use flake-like metal powders since their higher aspect ratios allow for better electrical conduction, as taught by the collective teachings of Kodas and Kang.

Maeda does not specifically disclose the amount of metal powder in the solder paste. Mei discloses that the soldering paste is *typically* will be formed by combining

the flux to form a paste comprising *about* 50 vol% solder to 50 vol% flux. This is not within the range of 1-20 vol% as disclosed by the claim; however, Mei discloses that this is *typically* the amount used to form the paste which indicates that other amounts are also possible. Mei also states that the concentration of coated metal powder in the solder paste can affect various properties of solder paste such as, for example, viscosity, ease of deposition, slumping, tack retention and shelf life and also that the concentration of solder powder in the paste also affects the thickness of the solder remaining after the paste is re-flowed (column 4 lines 56-66). This would indicate that it would have been obvious to one of ordinary skill in the art at the time of the invention to determine a suitable amount of powder to flux within the solder paste to create a solder paste with properties desired for the bonding process since it has been held that discovering an optimum value or a result effective variable involves only routine skill in the art. *In re Boesch*, 617 F.2d 272, 205 USPQ 215 (CCPA 1980).

Maeda with Mei, Kang and Koda do not specifically disclose that the soldered portion is uniformly formed by the solder portion and most of the metal powder included in the soldering paste for coating in step (a). However, since the soldered portion is formed from the solder portion and the metal powder included in the soldering paste for coating in step (a) and since the combined prior art discloses a similar bonding process as the claimed invention, it is the Examiner's position that the soldered portion is uniformly formed by the solder portion and most of the metal powder included in the soldering paste for coating in step (a).

Regarding claim 10, Maeda discloses that the first electrode 18 and the second electrode 12 protrude from the respective substrates.

4. Claim 8 is rejected under 35 U.S.C. 103(a) as being unpatentable over Maeda et al (US 6,189,771) in view of Mei (US 6,680,128), and further in view of the collective teachings of Kodas (US 6,951,666) and Kang et al (US 5,837,119), as applied to claim 4 above, and further in view of Taguchi et al. (2003/0121564).

Regarding claim 8, Maeda with Mei disclose that the activator may be an aromatic acid (column 4 line 32-48), but not specific to the type of aromatic acid. However, Taguchi discloses using dihydroxybenzoic acid (an aromatic acid) in a solder flux (paragraph 0055). To one skilled in the art at the time of the invention it would have been obvious to use dihydroxybenzoic acid in the flux of Mei because Taguchi states that it improves the spread ability of the solder (paragraph 0055).

5. Claim 9 is rejected under 35 U.S.C. 103(a) as being unpatentable over Maeda et al (US 6,189,771) in view of Mei (US 6,680,128), and further in view of the collective teachings of Kodas (US 6,951,666) and Kang et al (US 5,837,119), as applied to claim 4 above, and further in view of Kawabata et al. (JP2003-264259).

Regarding claim 9, Maeda discloses that the solder portion of the first electrode includes a solder portion and the second electrode includes a protruding portion corresponding to the solder portion. Maeda does not specifically disclose that the first

electrode includes a plurality of solder portions and a second electrode including a plurality of protruding portions corresponding to the plurality of solder portions.

However, Kawabata discloses a semiconductor device with first electrode 3A including a plurality of solder portions 10, 11 and second electrode 2A including a plurality of protruding portions corresponding to the plurality of solder portions (figure 1 paragraphs 0037). To one skilled in the art at the time of the invention it would have been obvious to have the first electrode include a plurality of solder portions a second electrodes including a plurality of protruding portions corresponding to the plurality of solder portions because it is well known in the art to have plurality of solder portions and corresponding electrodes when forming semiconductor devices.

Maeda also does not specifically disclose that at least one of the solder portions of the first electrode and at least one of the protruding portions of the second electrode are contacted, while at least one of the solder portions is not in contact with a corresponding one of the protruding portions.

However, Kawabata discloses using smaller balls/solder portions 11 on the outer corners and the central part of the semiconductor device when bonding where these smaller solder balls/solder portions do not contact the second electrode when the bigger solder balls/solder portions contact the second electrode (figure 1). To one skilled in the art at the time of the invention it would have been obvious to have the smaller solder balls/ solder portions on the outer and central part of the semiconductor device because Kawabata discloses that it allows for easy checking to ensure that the solder has

completely melted without having to perform an x-ray on the interior portion of the semiconductor device (paragraphs 0011-0018).

### ***Response to Arguments***

6. Applicant's arguments filed 8/12/2010 have been fully considered but they are not persuasive.

7. The Applicant argues that claim 4 would not have been obvious over the cited references because none of the cited references recognize or even suggest the migration problem which Applicant's have found, and therefore there is no basis to make the proposed modification absent reference to Applicant's specification, which is impermissible.

In response to applicant's argument that the prior art does not recognize the same problem as the Applicant, the fact that applicant has recognized another advantage which would flow naturally from following the suggestion of the prior art cannot be the basis for patentability when the differences would otherwise be obvious. See *Ex parte Obiaya*, 227 USPQ 58, 60 (Bd. Pat. App. & Inter. 1985). While Maeda with Mei might not recognize the migration problem as stated by the Applicant, it is the Examiner' position that Maeda with Mei does recognize another advantage of allowing for lower melting points, longer shelf life, and better effective wettability properties (Mei, Column 3, lines 5-10).

8. The Applicant argues that none of the references disclose "the solder portion easily wets and spreads along the surface metal when the solder portion is fluidized" because Mei does not intend to wet and spread the molten solder along surfaces of the metal powder because Mei describes that surface metals include copper or tin which are not expected to have an effect on wetting and spreading the molten solder along the surfaces of the metal powder guiding the molten solder.

The Examiner disagrees. This argument is mere allegation that the prior art does not teach that the solder portion easily wets and spreads along the surface metal when the solder portion is fluidized. The Applicant has provided no evidence to support this allegation. Furthermore, Maeda discloses that the solder portion is melted and the solder portion wets the metal paste (column 4 lines 22-36). It is the Examiner's position that the solder portion easily wets and spreads along the surface metal when the solder portion is fluidized since Maeda does disclose that the surface is "wetted".

Mei discloses that the surface metal may be silver or gold (as well as tin, copper or polymers). Silver and gold are similar materials to the present invention. Since Mei discloses that the surface metal may be similar materials to the present invention, it is the Examiner's position that surface metal of Mei would have the same wetting and spreading properties as the current invention.

9. The Applicant argues that the flaky form of the metal powder would not have better electrical conduction due to large aspect ratios since the flaky powder melts.

The Examiner disagrees. According to Kang, soldering or electrically conductive pastes (column 2, lines 20-25) with metal powders in the flaky form because of their

higher aspect ratios are more desirable than metal powder in the regular spherical form because flaky powders provide for better electrical conduction because of their larger aspect ratios, i.e. length of the flake is larger than the width of the flake (Kang, column 5, lines 35-40). Since the Prior Art teaches the motivation and the Applicant has not provided evidence to prove otherwise, the Examiner maintains that the flaky metal powder provides a better electrical conduction in the solder paste.

10. The Applicant argues that Kang discloses a conductive adhesive where the surface of dentide shaped copper is plated and Kang does not disclose the claimed metal powder and fails to disclose the aforementioned migration problem.

In response to applicant's argument that the prior art does not recognize the same problem as the Applicant, the fact that applicant has recognized another advantage which would flow naturally from following the suggestion of the prior art cannot be the basis for patentability when the differences would otherwise be obvious. See *Ex parte Obiaya*, 227 USPQ 58, 60 (Bd. Pat. App. & Inter. 1985). While secondary reference, Kang, might not recognize the migration problem as stated by the Applicant, it is the Examiner's position that Kang does recognize another advantage of providing better electrical conduction because of their larger aspect ratios, i.e. length of the flake is larger than the width of the flake (Kang, column 5, lines 35-40).

11. The Applicant argues that the cited references do not disclose that the soldered portion is uniformly formed by the solder portion and most of the metal powder included in the soldered paste for coating in step a.

The Examiner disagrees. As stated in rejection above, this is considered new matter because the current specification does not implicitly or explicitly disclose "the soldered portion is uniformly formed by the solder portion and most of the metal powder included in the soldered paste for coating in step a" since the soldered portion is formed from the solder portion and the metal powder included in the soldering paste for coating in step (a) and since the combined prior art discloses a similar bonding process as the claimed invention, it is the Examiner's position that the soldered portion is uniformly formed by the solder portion and most of the metal powder included in the soldering paste for coating in step (a).

### ***Conclusion***

Any inquiry concerning this communication or earlier communications from the examiner should be directed to ERIN B. SAAD whose telephone number is (571)270-3634. The examiner can normally be reached on Monday through Thursday from 8am-5pm Eastern time.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Jessica Ward can be reached on (571) 272-1223. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
